

Rendezvous with the Senses: A Brainstem's Journey

Edison Tenecela

This is an imaginative art piece that seamlessly integrates the sensory organs, the central nervous system, and elements of the natural world. It creates a thought-provoking exploration in which the mind blends into the very environment it seeks to understand. By showcasing sensory structures such as the eyes and lips, along with the nervous system and limbic system (such as the brainstem and thalamus), the piece encourages a deeper appreciation of the connections between sensory function, perceptual processing, and the surrounding environment.
